Expand the vector version of the text editor as described in Exercise 5.8.1 of the course notes. Don’t forget to add the new commands to the menu of options. The source code of the text editor is available on the course web site.

You are strongly encouraged to expand the program gradually, one feature at a time. You can also break the implementation of some of the new features into several parts.

This is an individual project. If you are stuck on something, you can ask for help from another student, the TA or the instructor. You should not ask for help from anyone outside the class or look for help on the web. In any case, you should write your own code.

Hand in the following:

• All your source code (but no executables).

• A status report that states whether your program works. If your program doesn’t work correctly, explain what the problems are. If your program is not complete, describe what is left to do.
